## Professional Certification Program

## Exam C1000-144

## IBM Machine Learning Data Scientist v1

Sample Test

- 1. Given an SQL table 'Books' with fields Title, Author, and Genre, which query would return a list of unique Genre values?
- A. SELECT Genre FROM Books;
- B. SELECT SET Genre FROM Books;
- C. SELECT UNIQUE Genre FROM Books;
- D. SELECT DISTINCT Genre FROM Books;
- 2. What are two reasons a data point would be treated as an outlier?
- A. If the value is greater than mean
- B. If the value is greater than median
- C. If the value is greater than standard deviation
- D. If the value is below the upper end of the bottom quartile by more then 1.5 times the interquartile range
- E. If the value is above the lower end of the top quartile by more then1.5 times the interquartile range
- 3. What is the reason oversampling on the minority class should be performed after the train test is split and not before?
- A. To not risk reducing the value of the recall
- B. To not risk reducing the value of the accuracy
- C. To not increase the number of records in the testing dataset
- D. So there is not duplicate records in both the training and testing datasets
- 4. A Logistic Regression algorithm is used to classify images into four categories. If each image has a 5x5 pixel dimension, what is the the number of weights required (excluding biases) for this model?
- A. 100
- B. 200
- C. 300
- D. 400
- 5. K-nearest neighbors and K-means clustering with Euclidean distance suffer from the curse of dimensionality.

Is the above statement true and why?

A. This is true. Euclidean distance, in general, is not a good metric in a

high-dimensional space.

- B. This is false. K-nearest neighbors can effectively work with a high-dimension space if K is small.
- C. This is true. As K increases, the number of samples required grows linearly with respect to the dimension and K.
- D. This is false. K-means clustering can effectively work with a high-dimension space if given a large number of samples.
- 6. What is one way that IBM AutoAl helps make it easier for data scientists to determine what key fields to use to join data tables?
- A. AutoAl automatically suggests joining on fields in different tables that have matching names.
- B. AutoAl automatically suggests joining on fields in different tables that have matching values.
- C. AutoAl automatically suggests joining on fields in different tables when those tables have the same number of rows.
- D. AutoAl automatically suggests joining on fields in different tables when those tables have the same number of fields.
- 7. The Bayesian optimization algorithm for hyperparameter tuning has which trait?
- A. It can be used for both regression and clustering but cannot be used for classification.
- B. It requires that a user provide a list of all of the values that will be tested for each hyperparameter.
- C. It builds a machine learning model to predict which hyperparameter settings will be most effective.
- D. If sufficient hardware is available, it can try out many different hyperparameter settings at the same time.
- 8. What does an R^2 Score (coefficient of determination) measure?
- A. It computes the average squared difference between estimated values and the actual value.
- B. It computes the square root of the average squared difference between estimated values and the actual value.
- C. It represents the proportion of the variance in the independent variable that has been explained by the dependent variable.
- D. It represents the proportion of the variance in the dependent variable that has been explained by the independent variable(s).

- 9. Converting a neural network into the newest version of TensorFlow or another deep-learning package is what type of performance drift or software decay?
- A. Data changes
- B. Concept drift
- C. Software changes
- D. Sampling bias and selection bias changes
